Genomics and Pediatric Cancers

The application of genomics to identify diagnostic biomarkers, drivers and therapeutic targets for pediatric cancers

Jun S. Wei, Ph.D.
Oncogenomics Section
Genetics Branch
Center for Cancer Research
National Cancer Institute

TRACO
October 31, 2016

Outline

Outline

- Success and Challenges of Treating Pediatric Cancers
- Genomics
- Next-generation Sequencing
- Application of next-generation sequencing:
  - Diagnosis
  - Identification of molecular target
- Precision Therapy

Childhood cancer

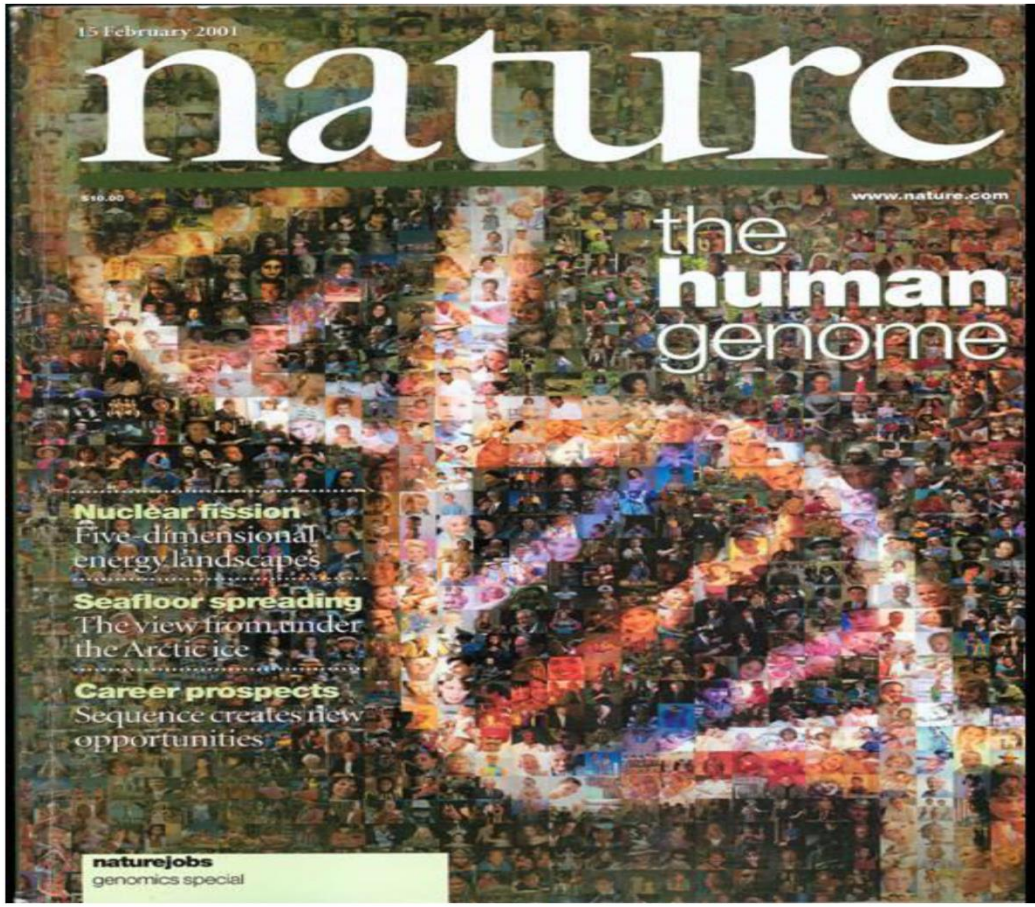
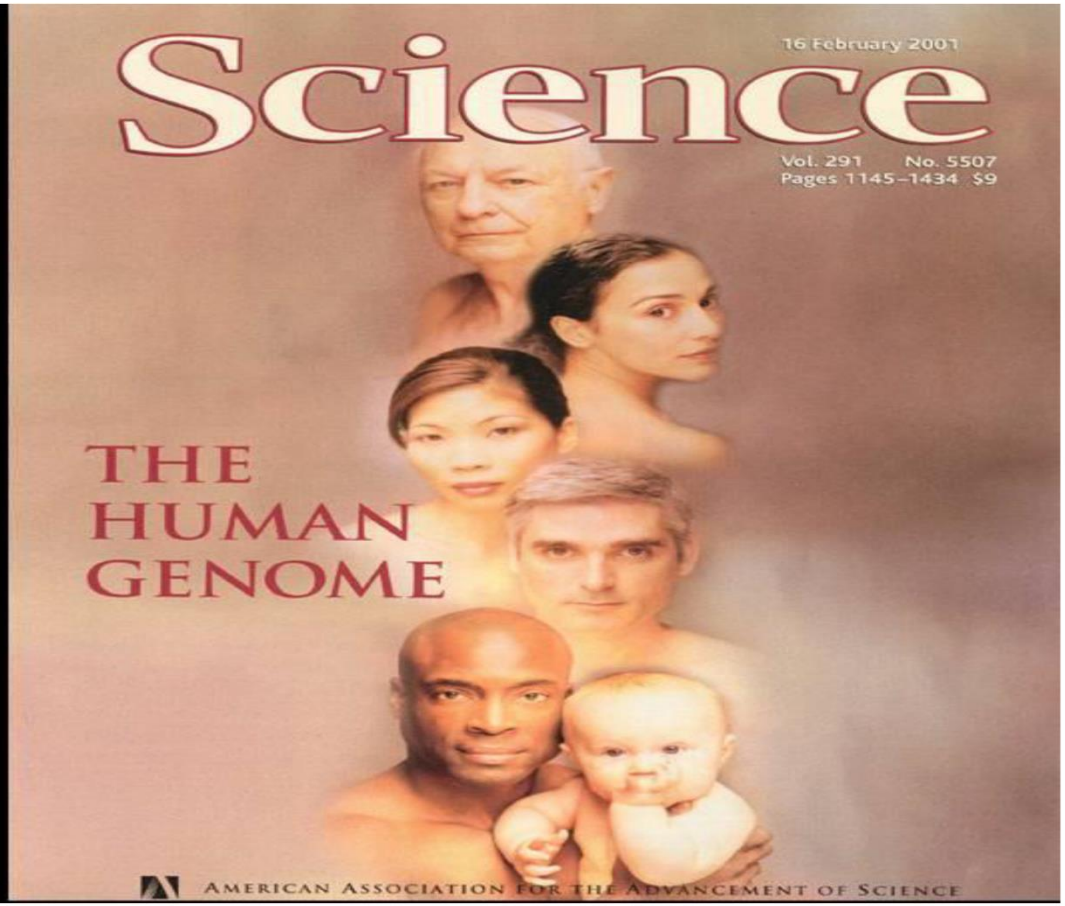
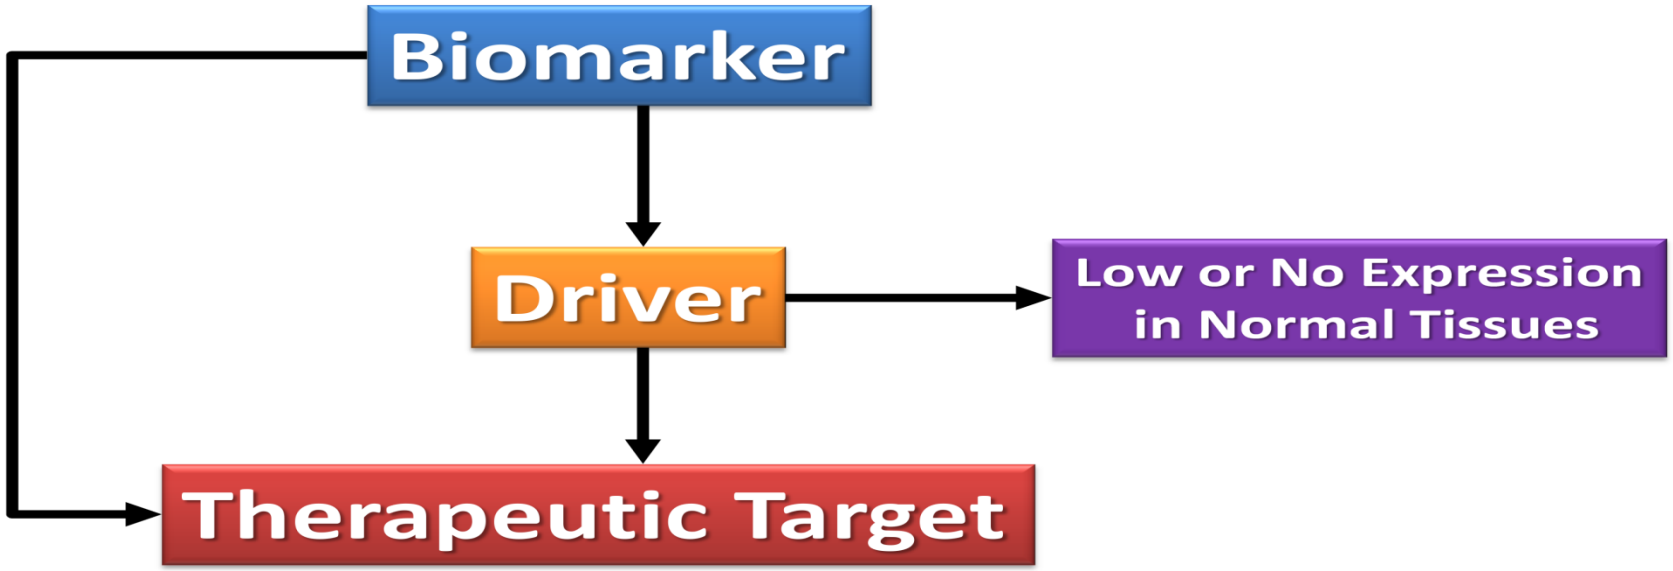
Human genome





Genomic research

Genomic Research – identification of biomarker, driver, and target



Gene measurement

Challenge: how to measure/detect genes and their products in a massively parallel way?

- **High-throughput technologies**
- **Computational power**

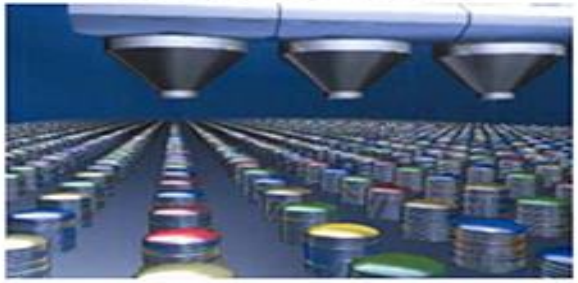
First generation tools

1st generation genomic tool: microarrays

Printing microarrays

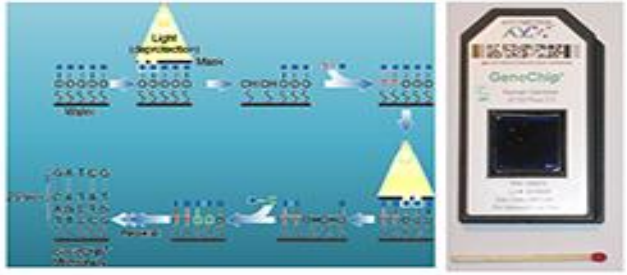
Mechanical

Electronic Piezo

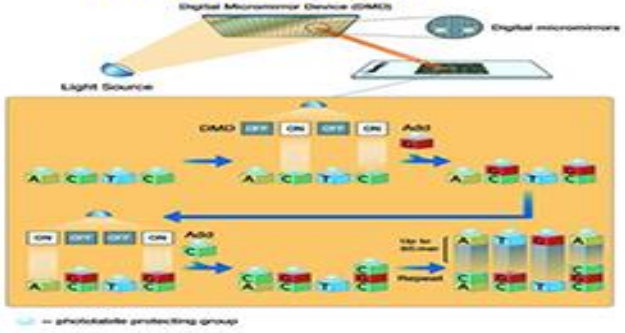


In-situ synthesis microarrays

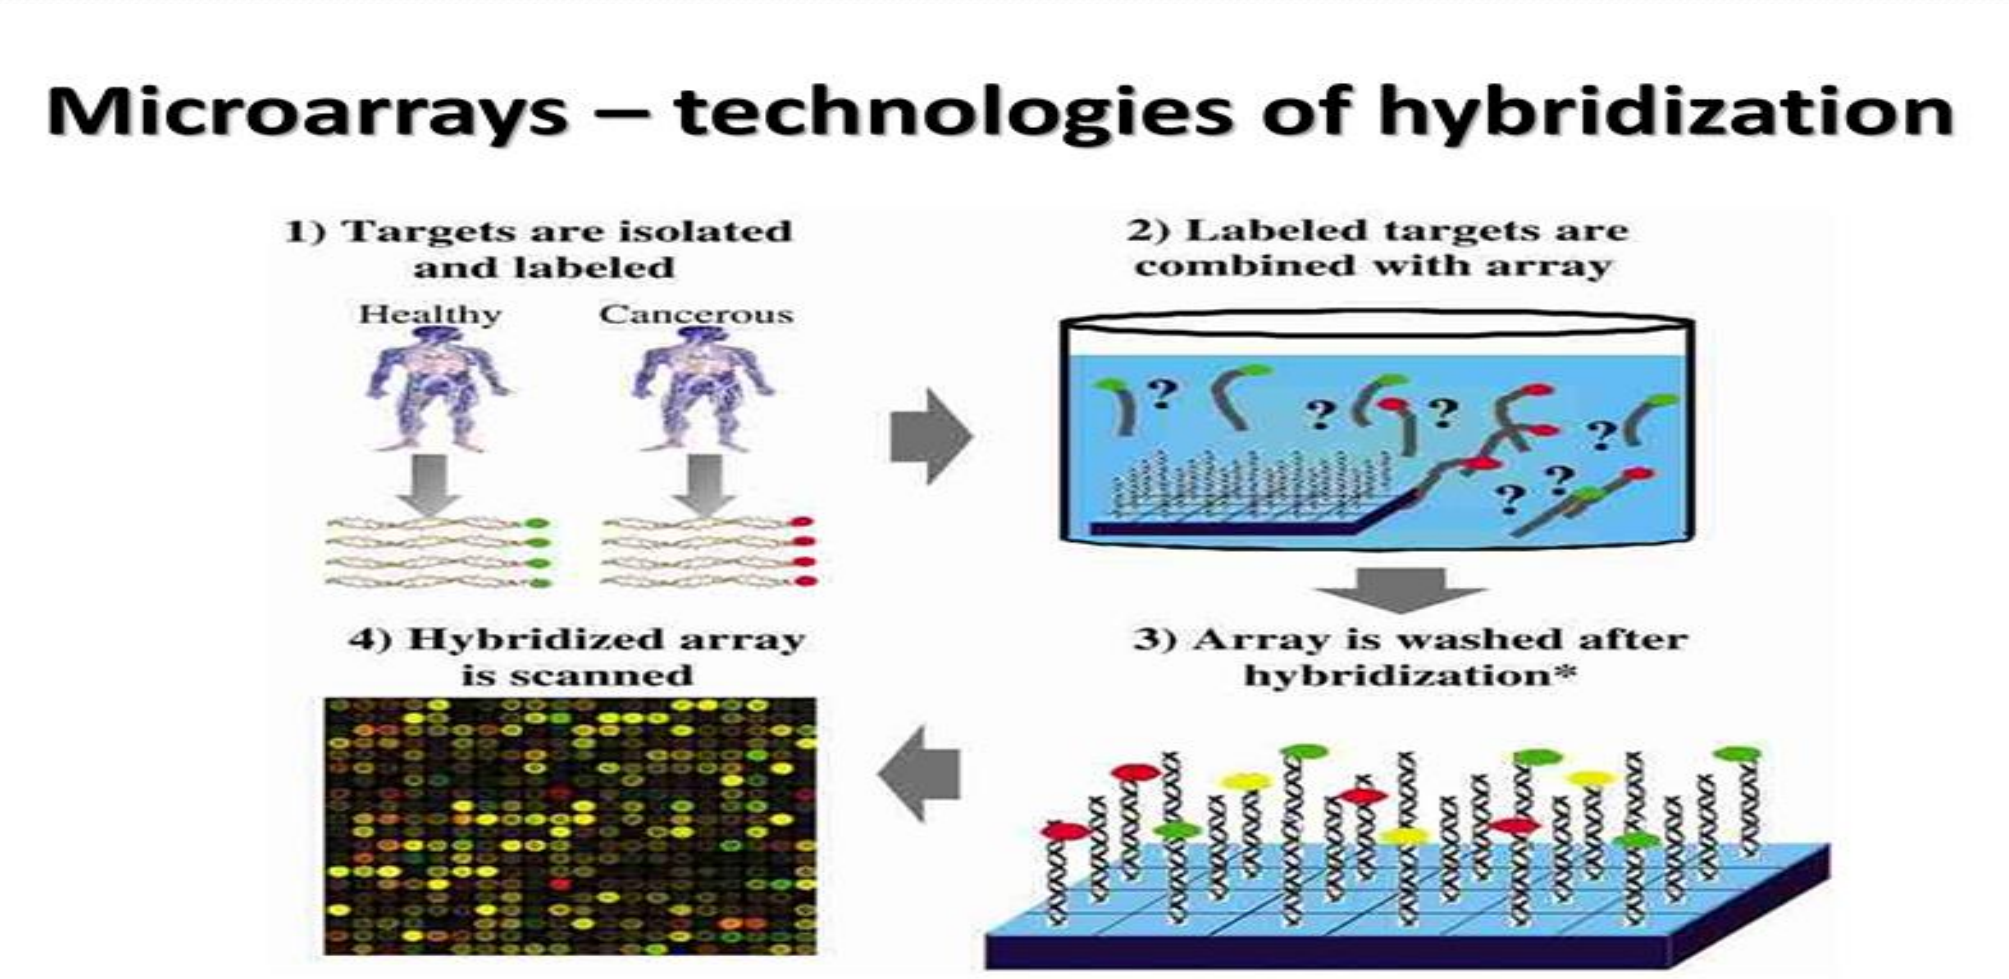
Lithographic masks and de-protection through illumination



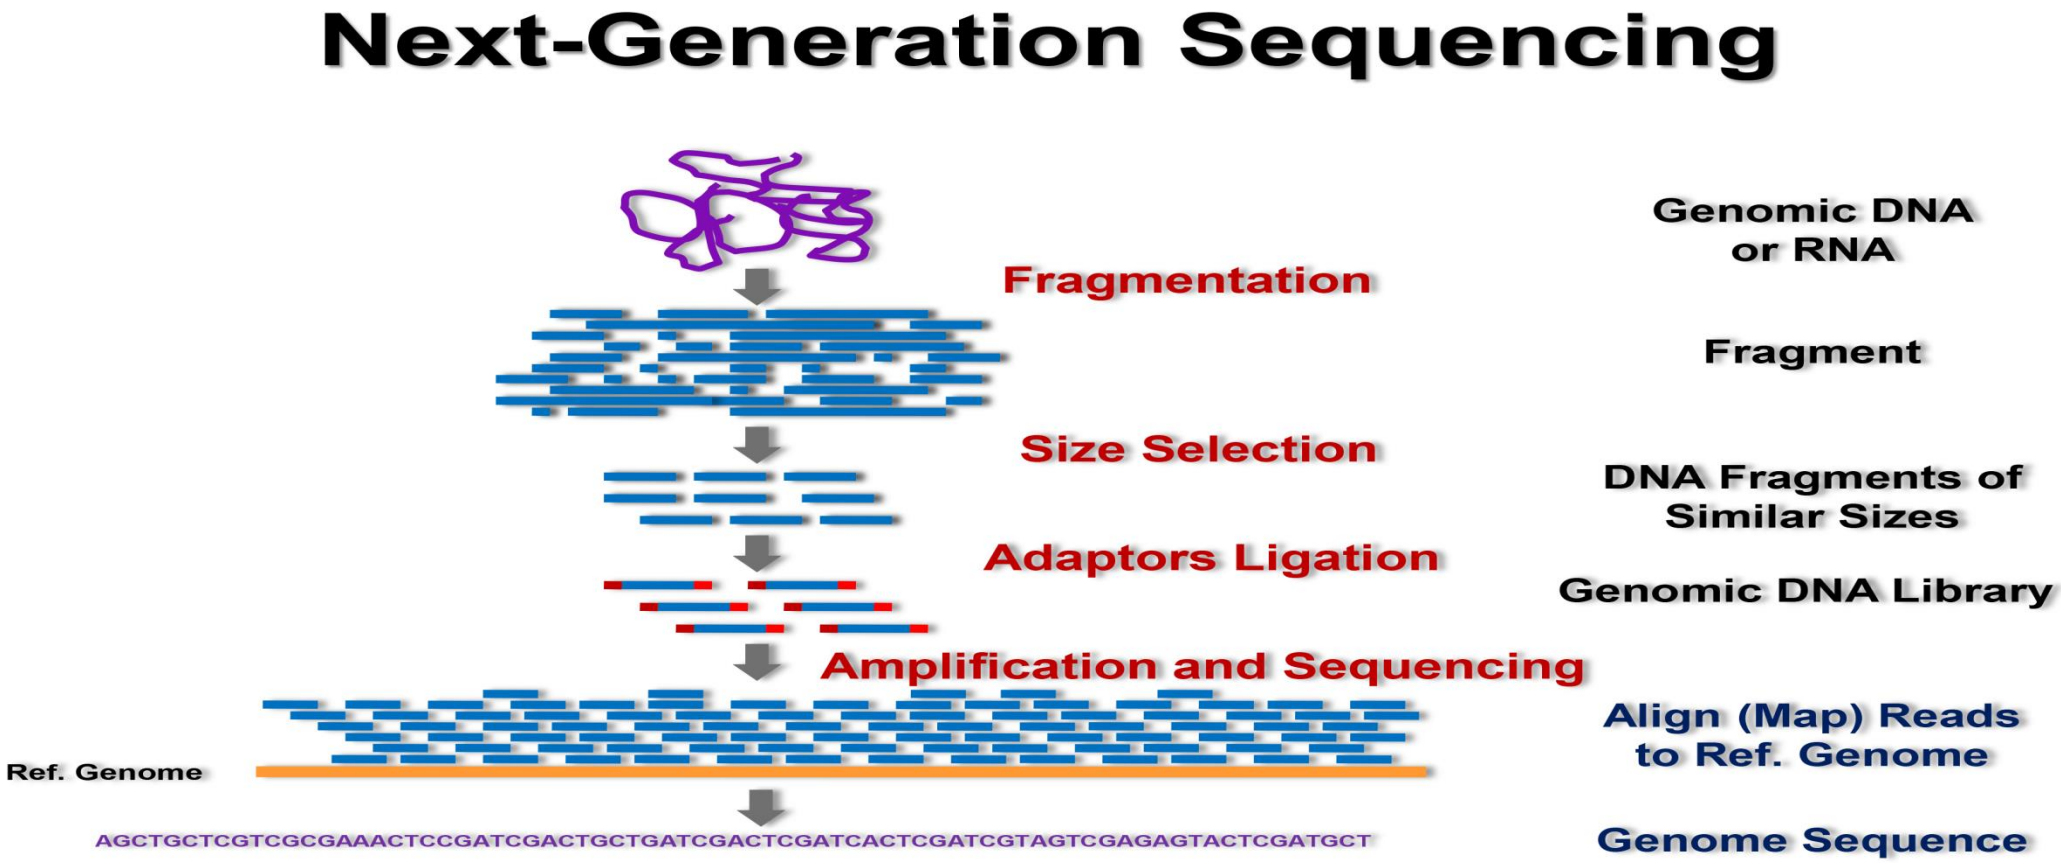
Digital micromirrow device (DMD)



Microarrays

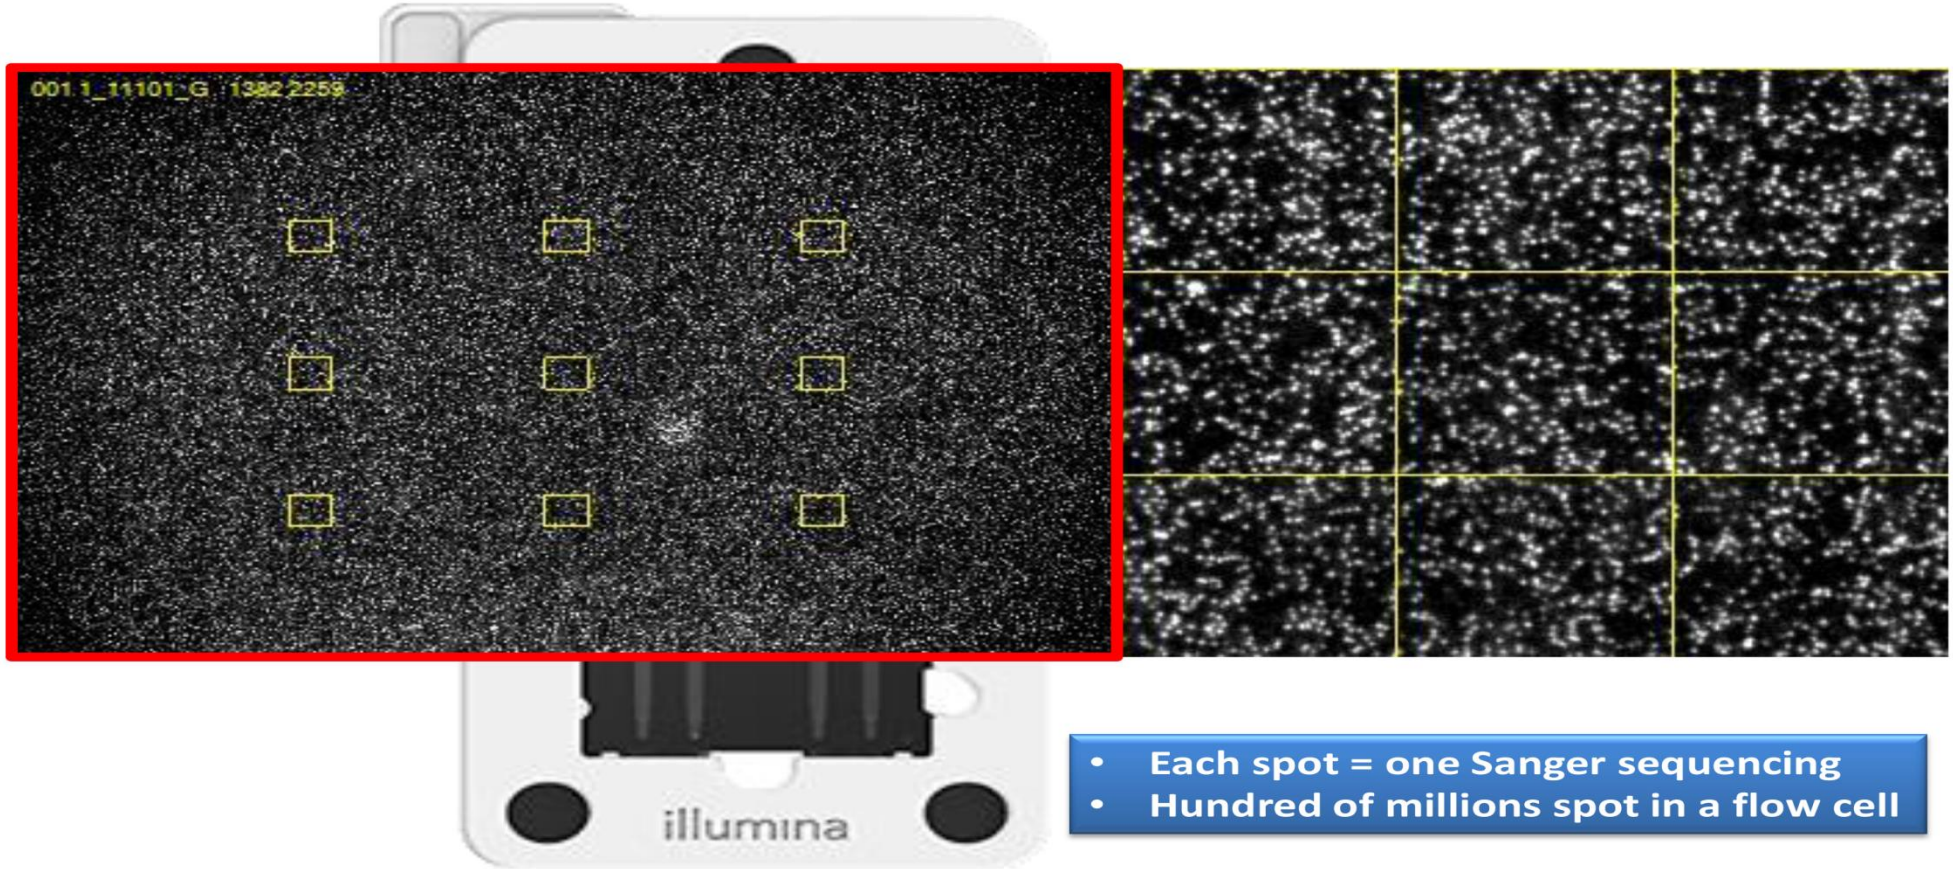


Next-generation sequencing



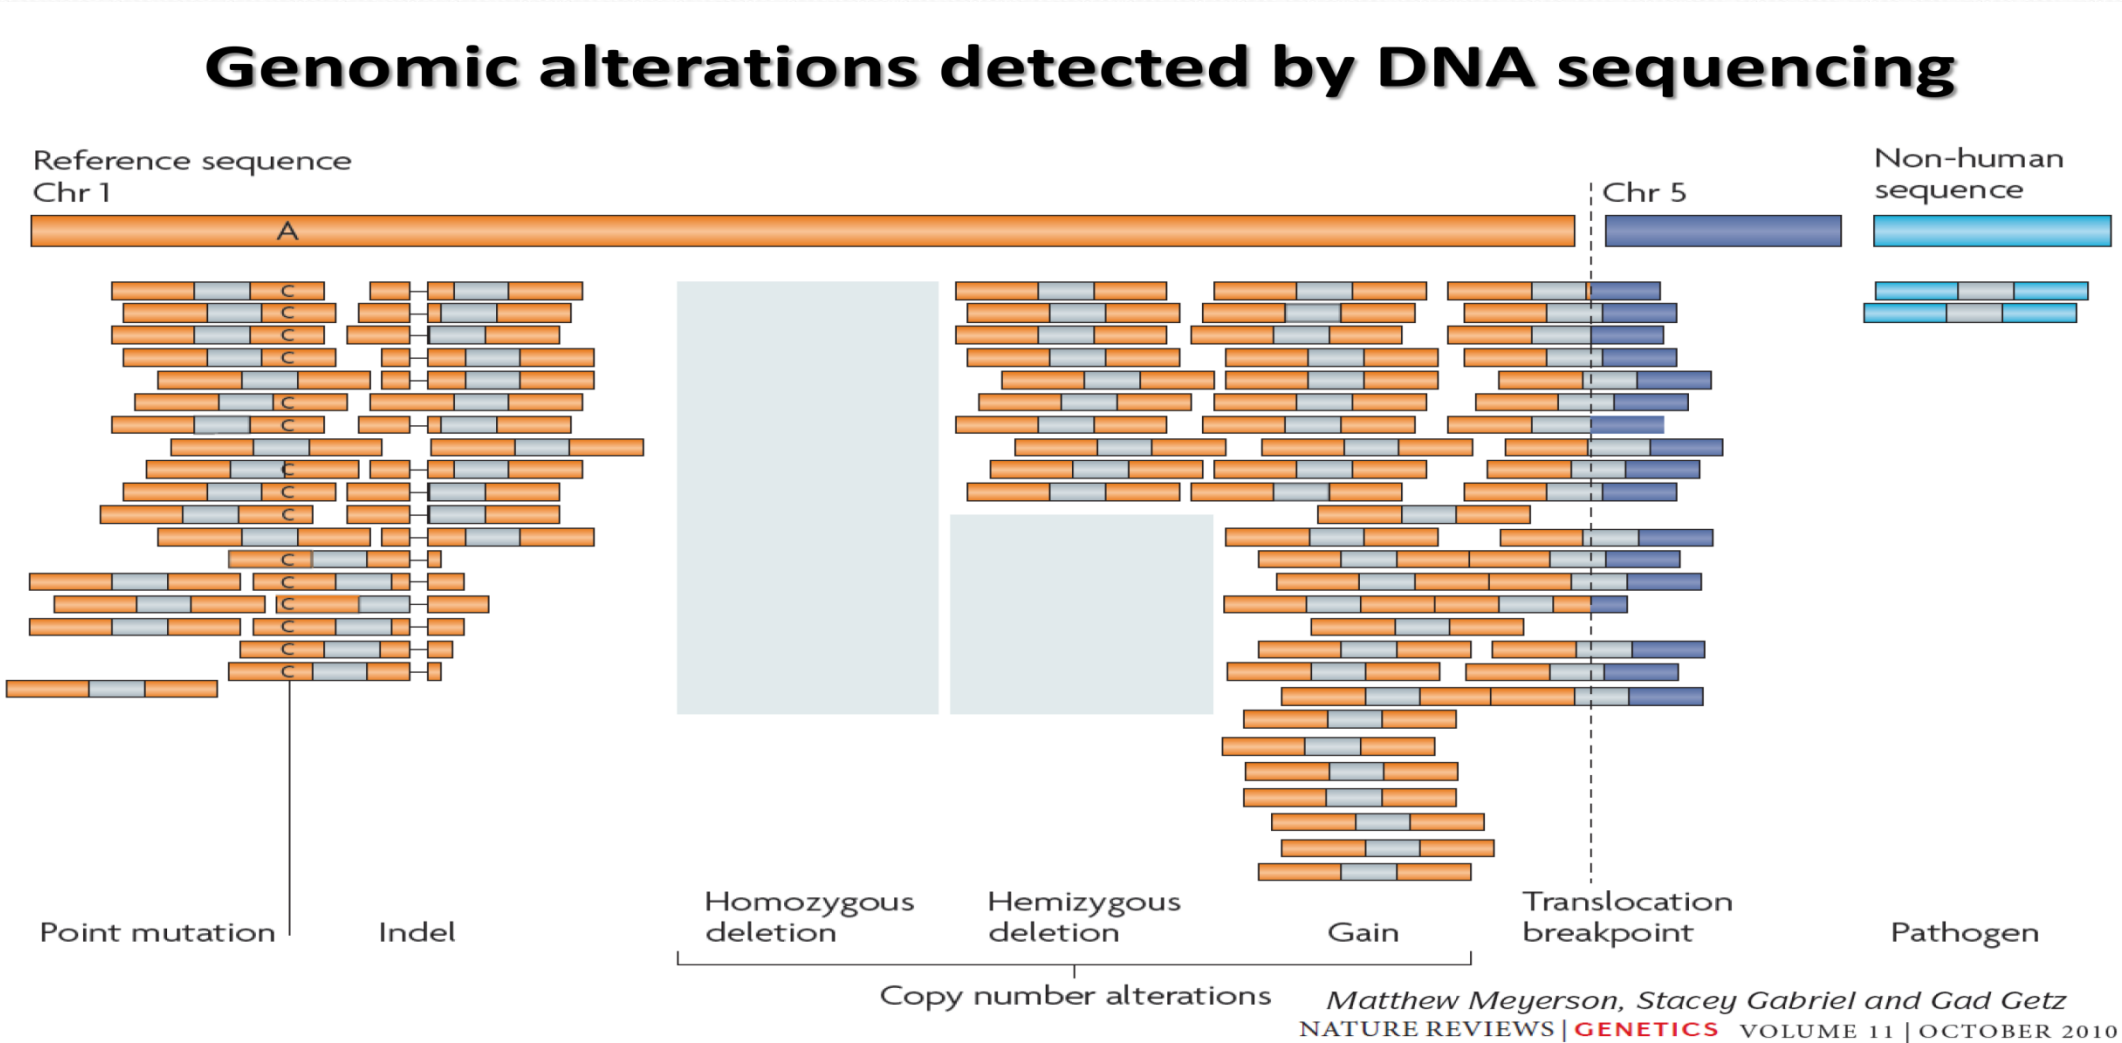
Massively Parallel Sequencing

Massively Parallel Sequencing



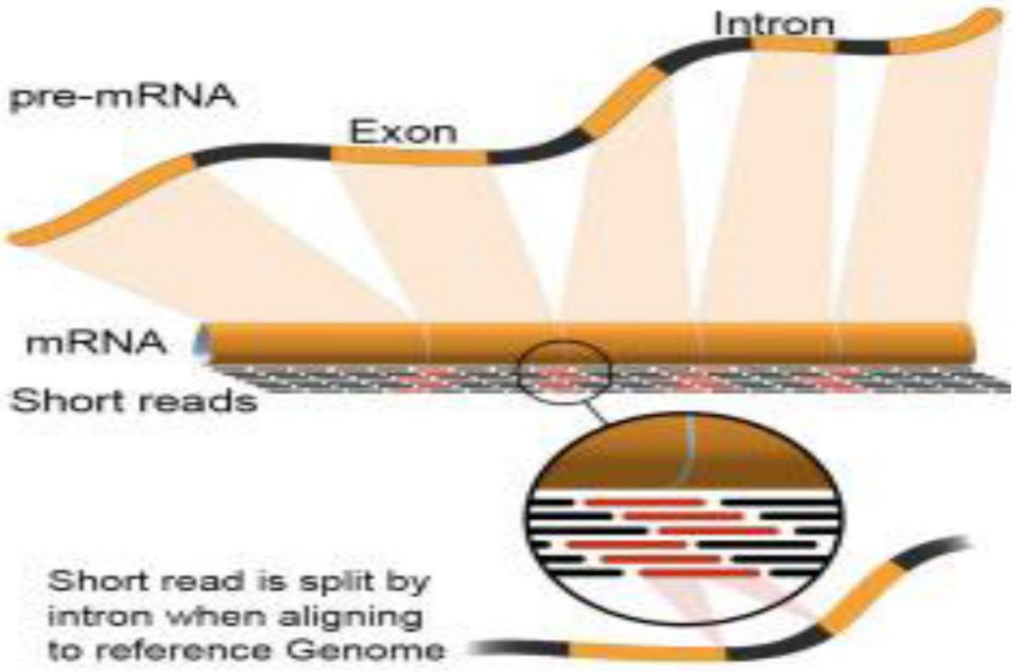
- Each spot = one Sanger sequencing
- Hundred of millions spot in a flow cell

Genomic Alterations



Genomic Alterations

Genomic Alterations Detected by RNA Transcriptome Sequencing



- Digital Gene Expression
- Expressed Mutations
- Alternative Splicing Events
- Expressed Fusion Transcripts
- RNA editing
- Novel Transcripts
- Non-coding RNAs

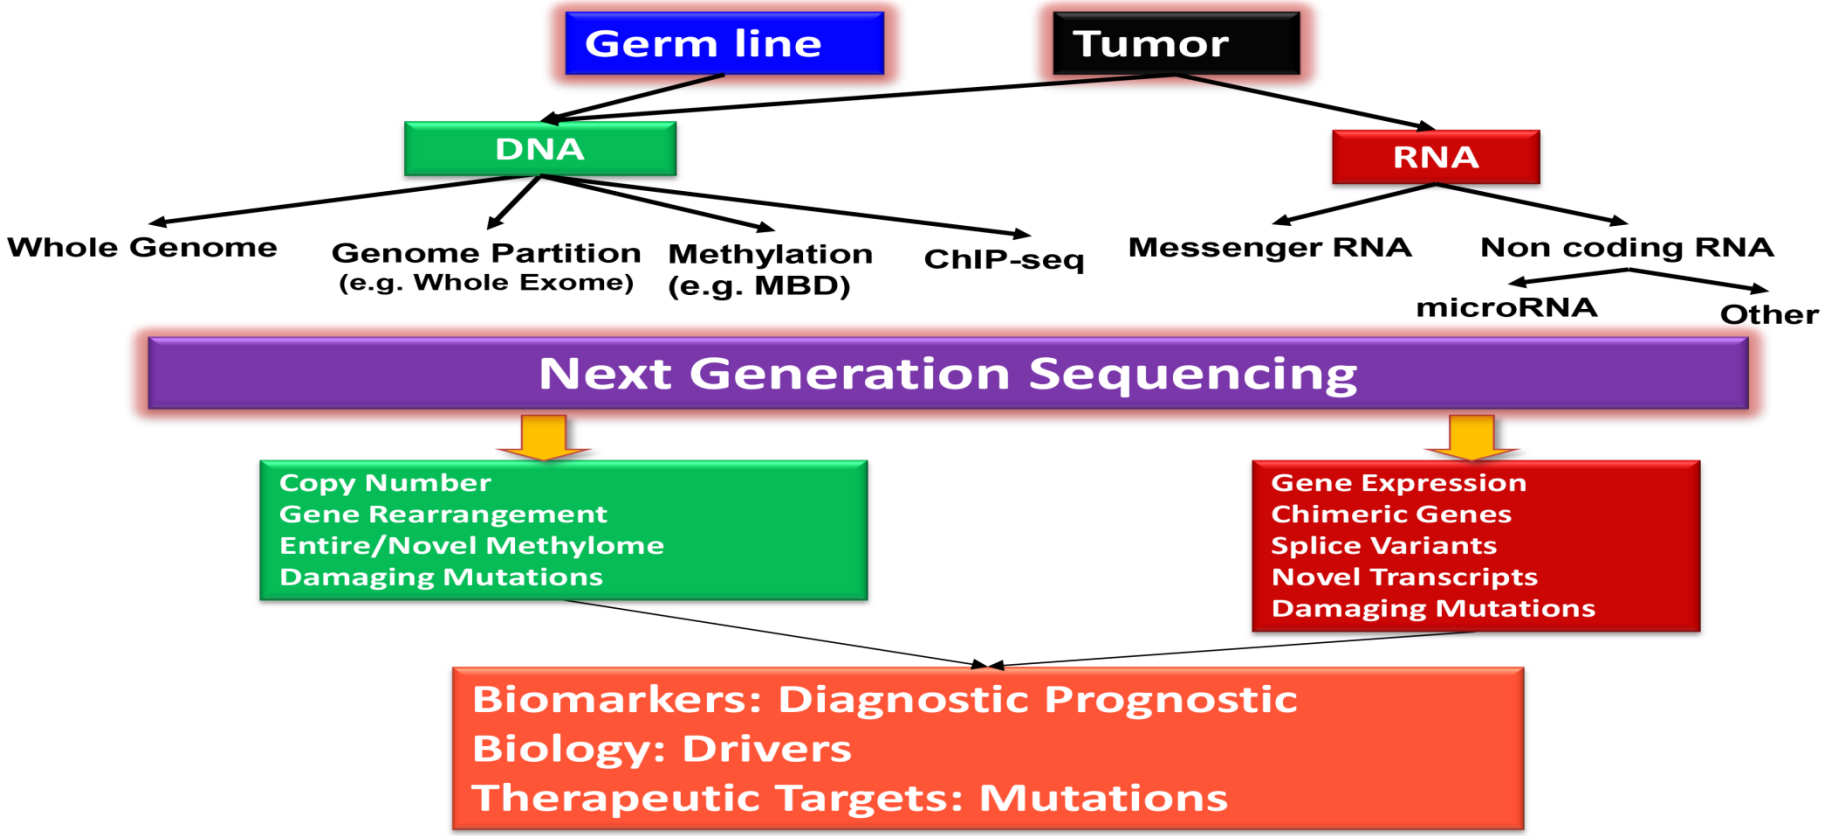
Properties

Properties of the next-generation sequencing technologies

- No need to prepare clones for DNA fragments
- No need of prior knowledge for probe design
- Able to detect balanced genome structure changes
- Parallel sequencing at basepair resolution– massive-throughput (up to 100s Gb/run)
- Cheaper (per nucleotide) and faster per genome

Cancer Genomes

Next Generation Sequencing Allows for Comprehensive Analysis of Cancer Genomes on the Same Platform



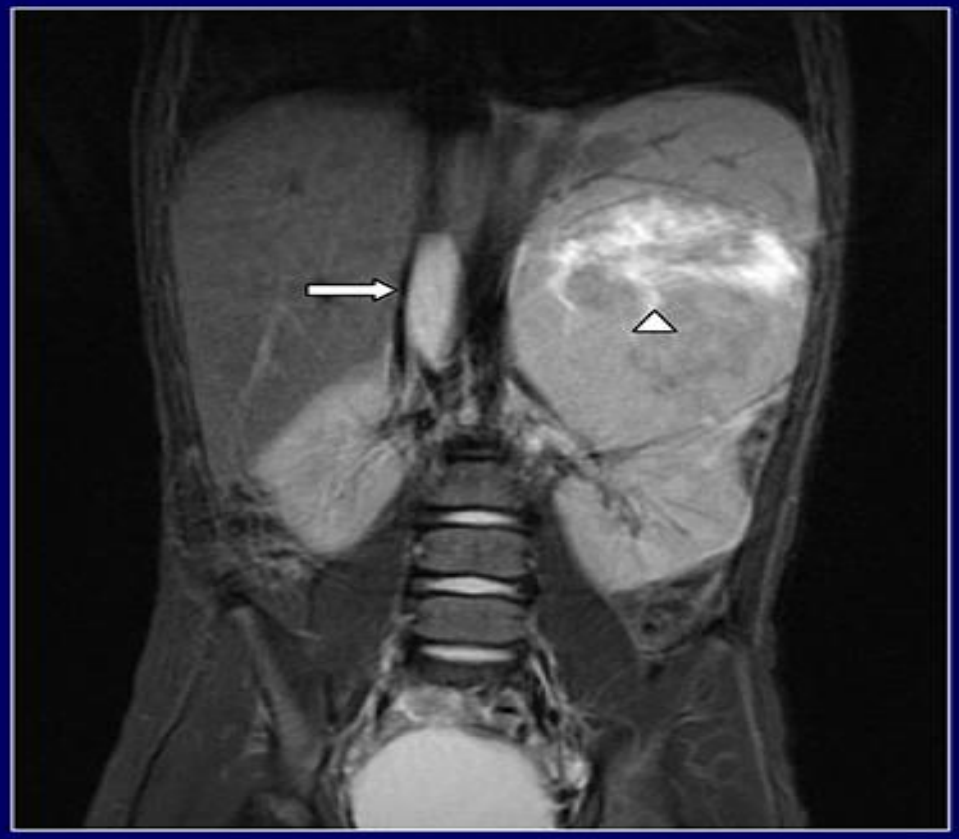
Clinical Vignette

Clinical Vignette
Use of Diagnostic Assay

- 4.5 year old female 2nd opinion from POB, NCI from Germany with questionable Diagnosis
- 6-week history of weight loss, reduced appetite, fever, abdominal pain
- On examination left sided abdominal mass

Wilms tumor

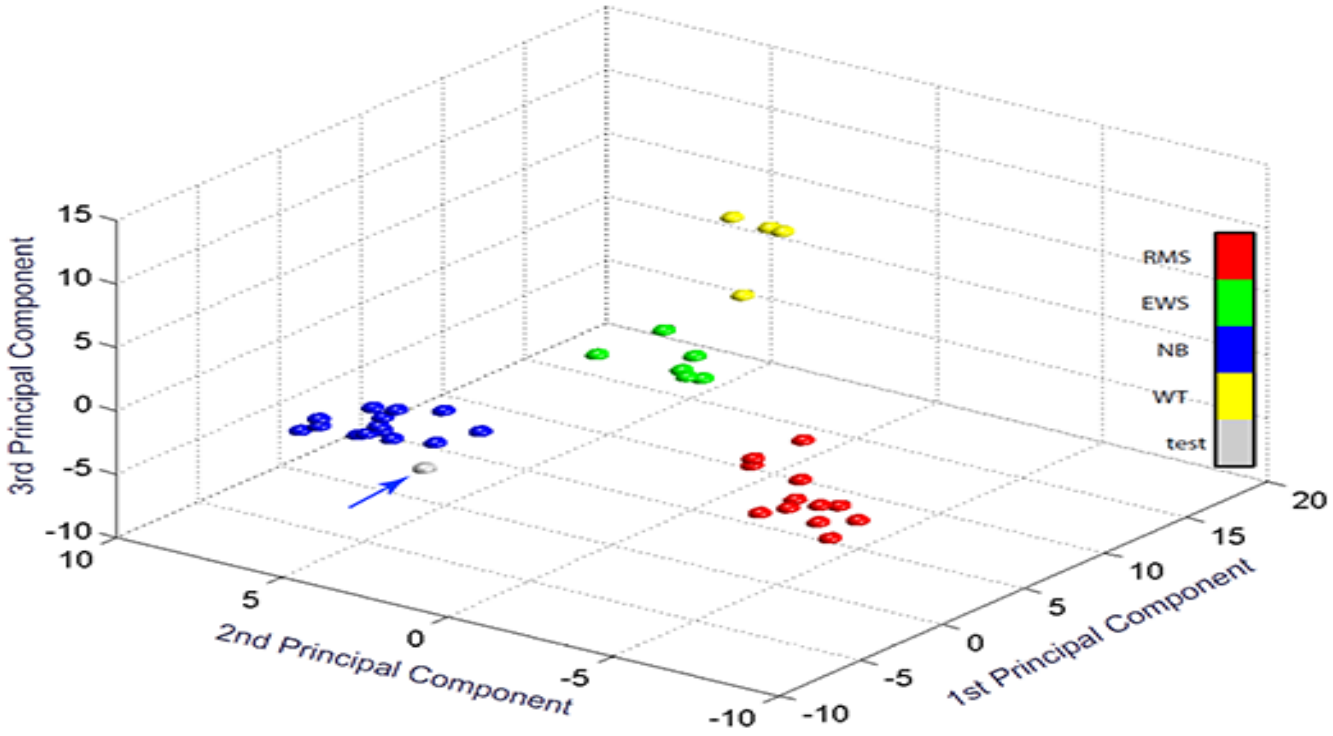
MRI: 9 x 8 x 9 cm mass in upper pole left kidney, tumor in Left renal vein and inferior vena cava



Initial diagnosis: Wilm's tumor

Cancer diagnosis

Diagnosis of cancers using gene expression profiles



Wilm's tumor

↓

Neuroblastoma

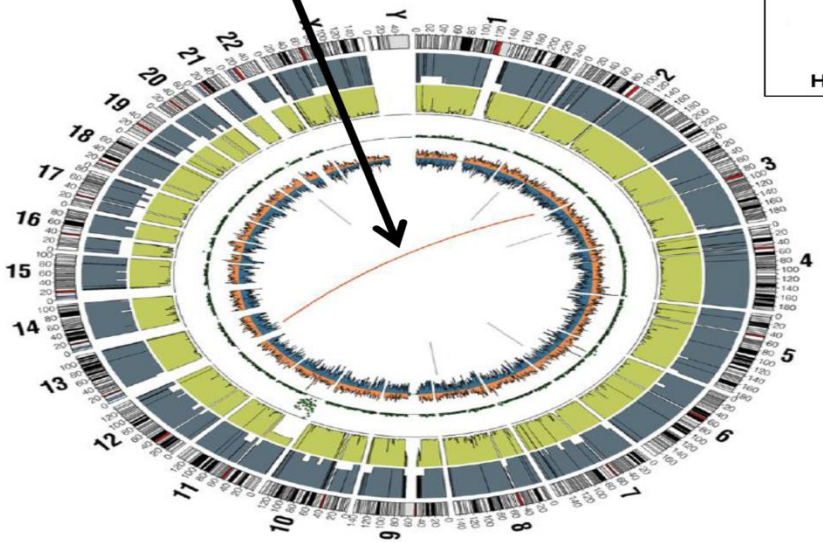
- **Patient was switched to high risk neuroblastoma treatment included stem cell transplant**
- **Doing well 1 yr after diagnosis**

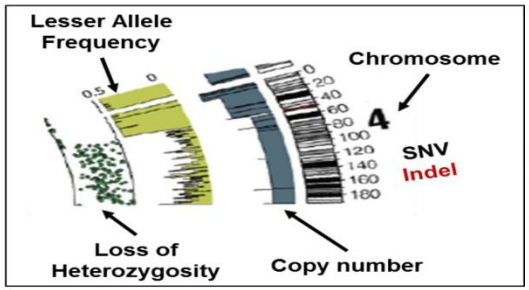
Diagnosis

Diagnosis of fusion positive pediatric tumors using whole genome sequencing

Rhabdomyosarcoma

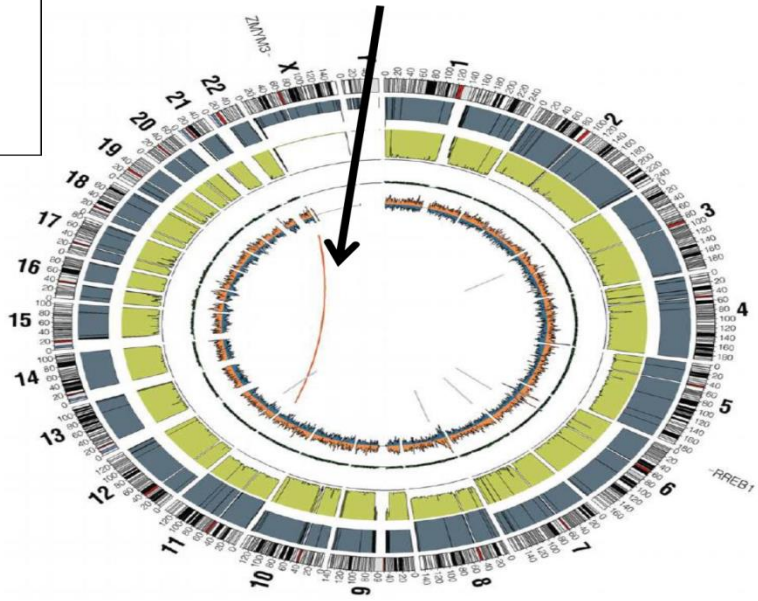
t(2;13) PAX3-FOXO1





Ewing's Sarcoma

t(11;22) EWS-FLI1



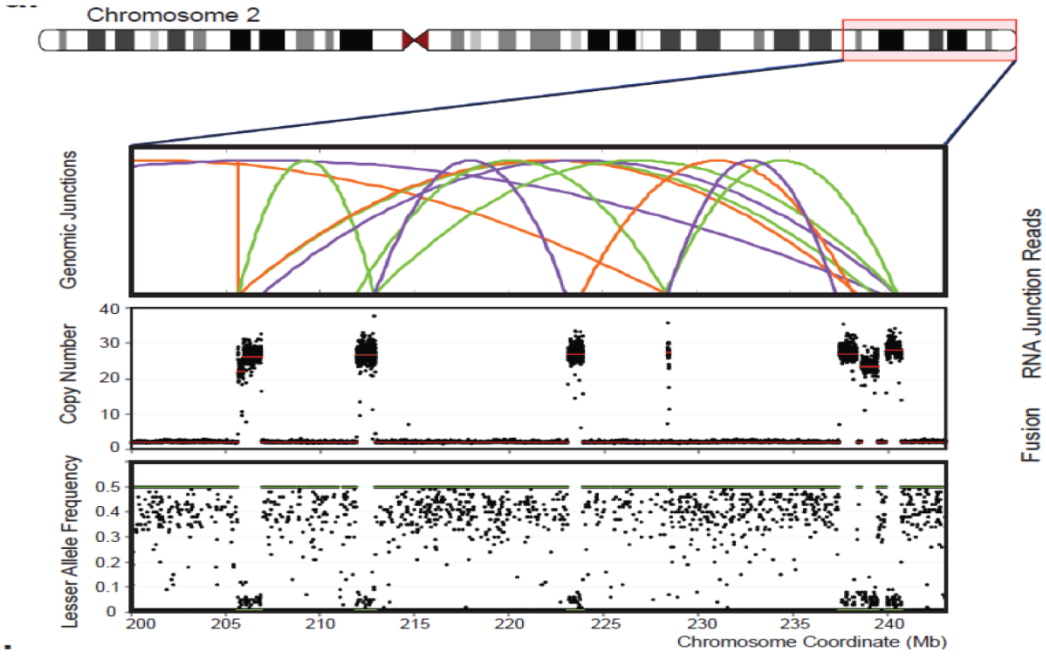
Shern et al., Cancer Discovery 2014, 4(2):216-31

Brohl et al., PLOS Genetics 2014, 10(7):e1004629

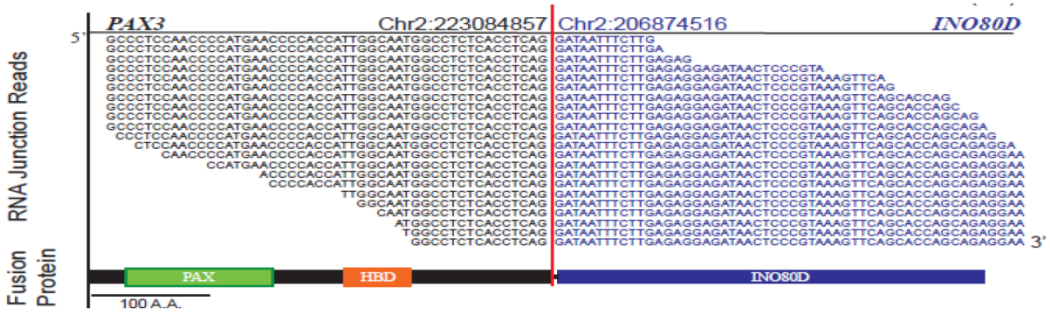
Rearrangement

Novel in-frame *PAX3-INO80D* fusion with massive 2q rearrangement in RMS,
Expression fusion gene verified by RNAseq

DNA

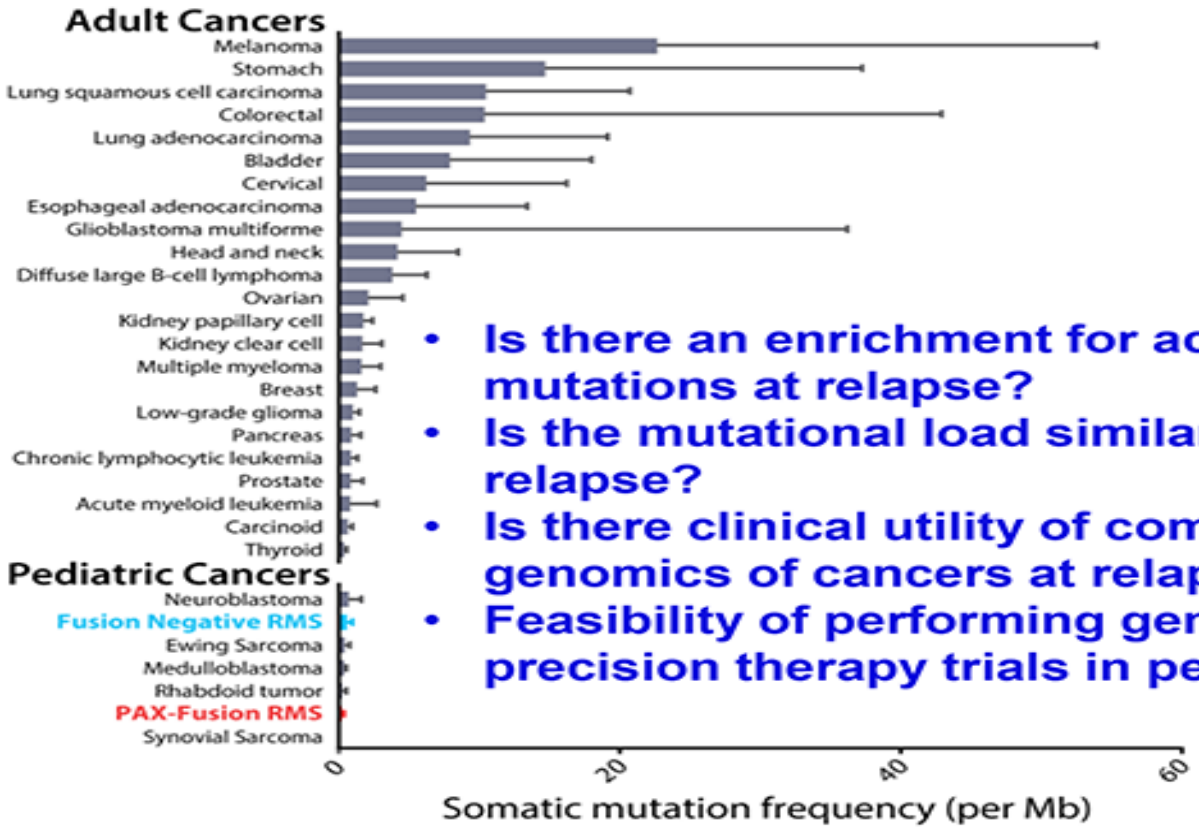


RNA



Pediatric cancer mutations

Pediatric cancers have a low number of somatic and actionable mutations at initial diagnosis



- Is there an enrichment for actionable mutations at relapse?
- Is the mutational load similarly low at relapse?
- Is there clinical utility of comprehensive genomics of cancers at relapse?
- Feasibility of performing genome guided precision therapy trials in pediatrics?

2014, *Cancer Discovery*, Shern, J. F. *et al.*, Comprehensive Genomic Analysis of Rhabdomyosarcoma **2013**, *Nature*, Lawrence, M. S. *et al.*, Mutational heterogeneity in cancer

Clin Cancer Res. May 2016

Protocol Number: 10-C-0086
Title: "Comprehensive Omics Analysis of Pediatric Solid Tumors and Establishment of a Repository for Related Biological Studies" or Omics protocol

Study design

Study Design

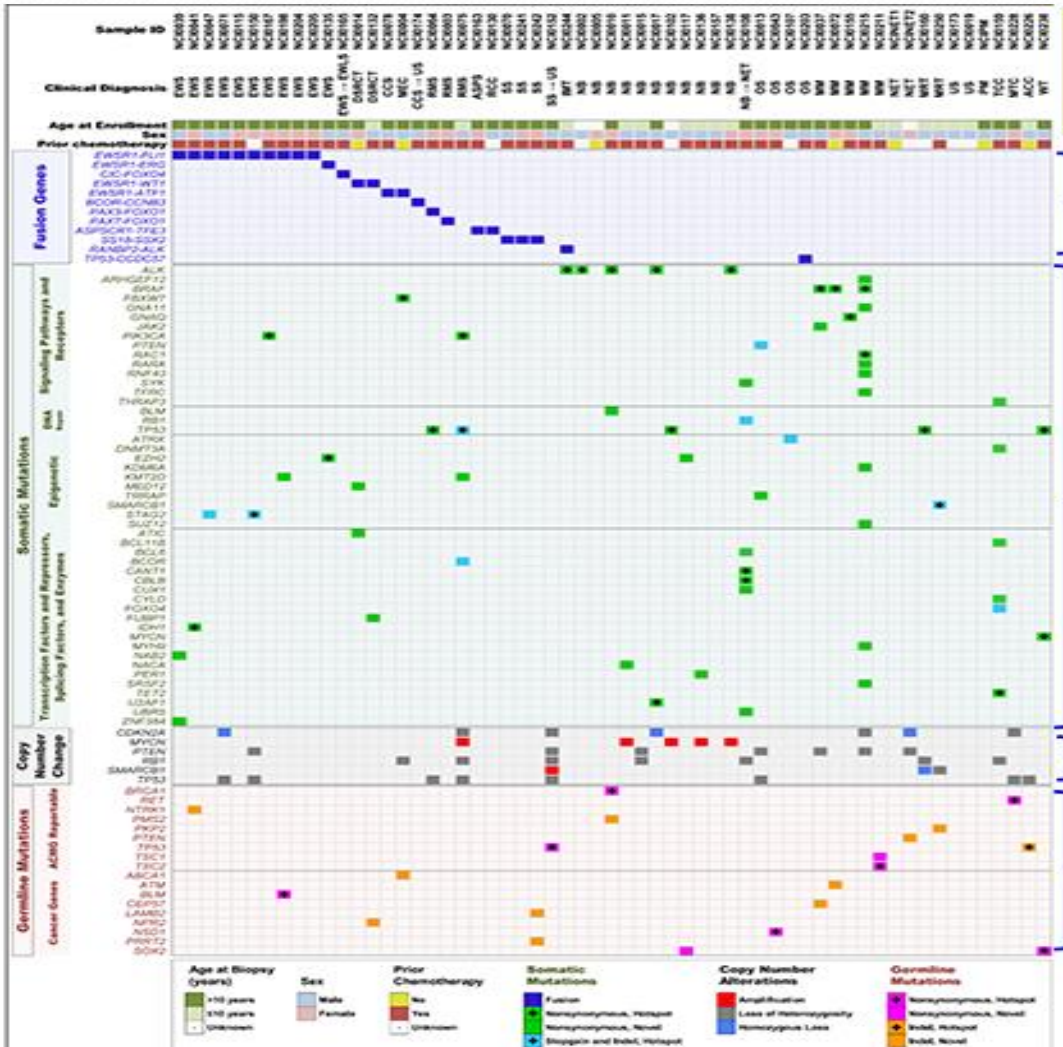
- Pilot study to determine the utility and feasibility of performing comprehensive genomic analyses to identify clinically actionable mutations in pediatric and young adult patients with metastatic, refractory or relapsed solid tumors
- 59 patients enrolled to the pediatric oncology branch, Center for Cancer Research (CCR), NCI (2010-2014)
- Age 7 months-25 years
- 20 diagnostic categories (non-CNS, solid tumors)
- Comprehensive multi-omics exome germline & tumor, RNAseq tumor & Illumina Omni SNP arrays of tumor

Mutations

Definitions: Actionable

- **Actionable germline mutation:** loss of function mutation or known hotspot activating mutation of a cancer consensus gene or pathogenic or likely pathogenic mutation of an American College of Medical Genetics (ACMG) Gene
- **Actionable somatic mutation:** genomic alterations that changes the patient's diagnosis, or may be targeted with FDA approved drugs or in the context of existing clinical trials according to the NCI-adult MATCH-Criteria

Multi-omics integrated landscape



Multi-Omics Integrated Landscape

RNAseq
Diagnostic, Driver, Actionable

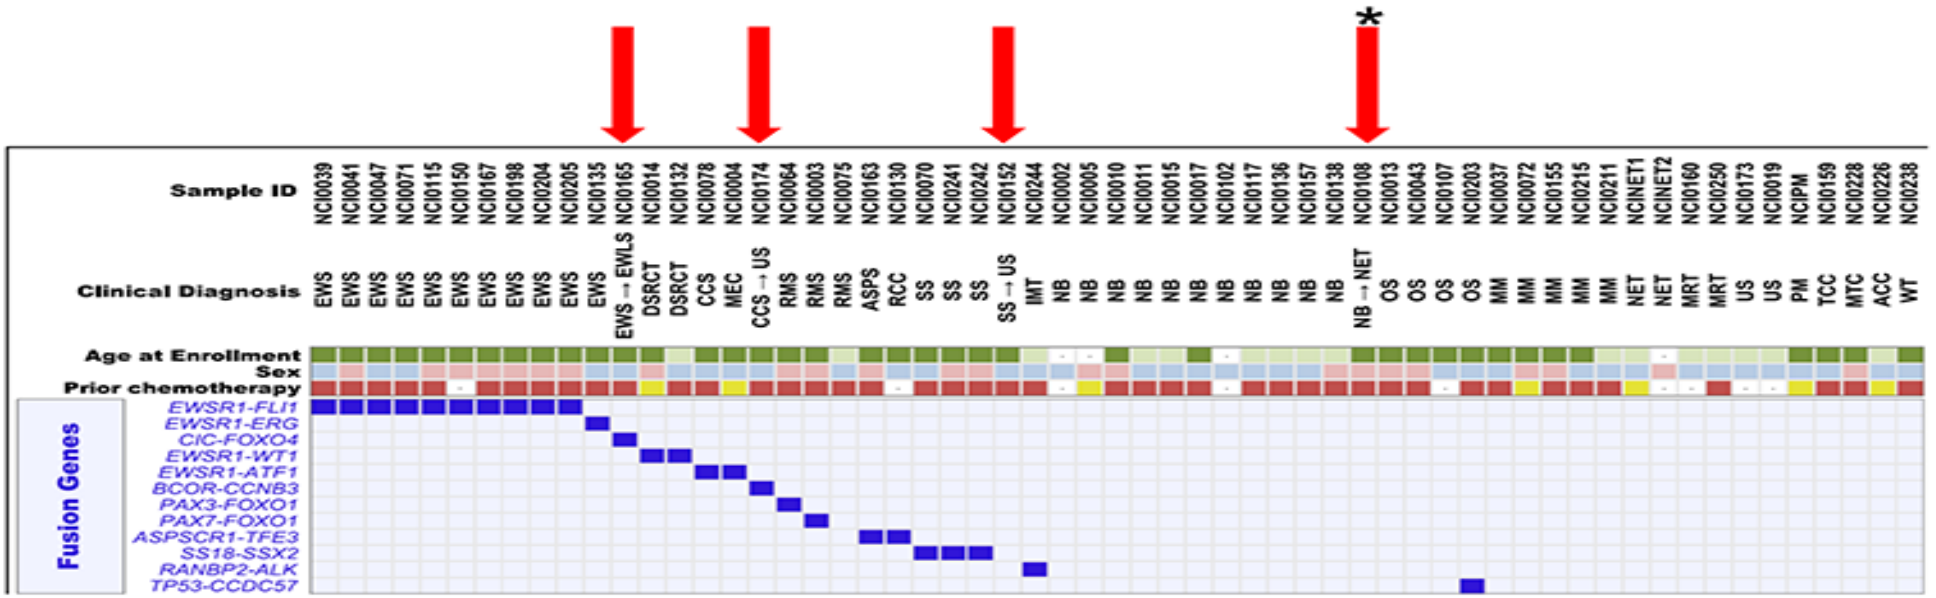
DNAseq and RNAseq
Somatic: Driver, Actionable

DNA copy number & RNAseq
Somatic: Driver, Actionable

DNAseq
Germ line: Disease causing, Actionable

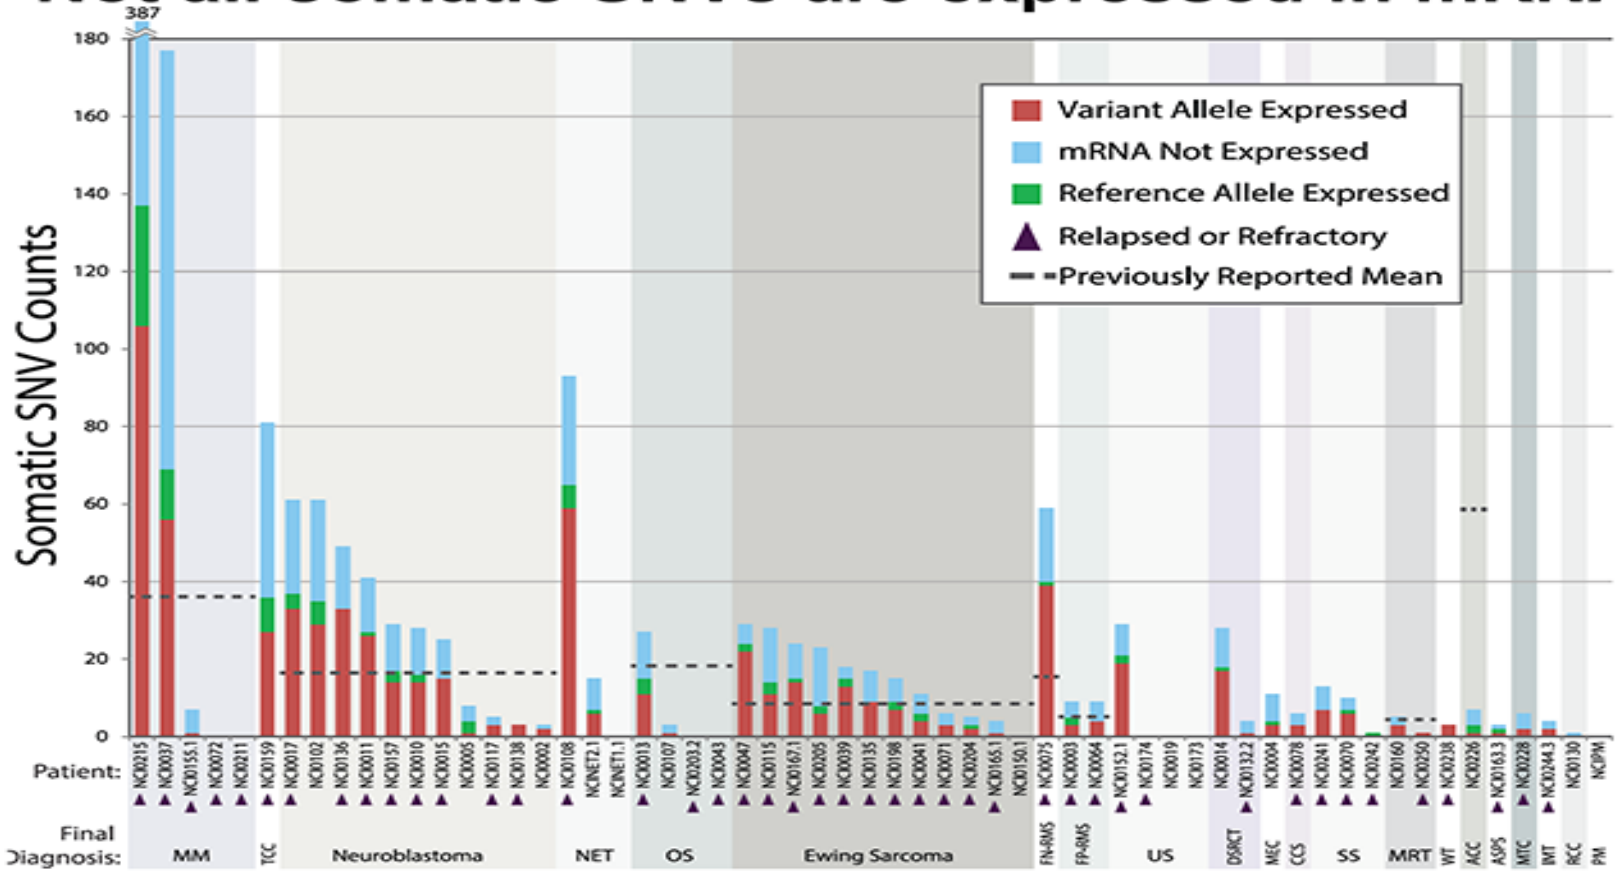
Fusion genes

Presence or absence of fusion genes and/or expression profiles confirms diagnosis or leads to revision of diagnosis



Somatic mutations

Somatic mutation burden at relapse increases 2-3X
Not all somatic SNVs are expressed in mRNA



Chang et al. Clin Cancer Res. 2016 Mar 18. pii: clincanres.2717.2015.

Match criteria

NCI-Adult MATCH
Criteria for Matching Mutation to Drug

Level 1	Gene variant approved for selection of an approved drug (BRAF V600E and vermurafenib). The variant will be Level 1 in all tissues open to treatment with the approved drug.
Level 2a	Gene variant is an eligibility criteria for an ongoing clinical trial for that treatment.
Level 2b	Gene variant has been identified in an N of 1 responses (TSC1 and everolimus) for that treatment
Level 3	Preclinical inferential data *(in vivo* and *in vitro* models*)* that provide biological evidence sufficient to support the use of a variant for treatment selection, e.g. • Models with variants respond to treatment and models without variant do not respond to treatment • Gain of function mutations demonstrated in pre-clinical model, e.g. D769H variant of ERBB2 results in increased tyrosine kinase-specific activity and up regulates pathway signaling (does not require treatment evidence) • Loss of function genes, tumor suppressor or pathway inhibitor (e.g. NF1) any variant that produces a stop codon including frameshift or demonstrated loss of function in pre-clinical model (does not require treatment evidence

Tumor mutations

Approximately 50% of Pediatric and Adolescent Young Adults with Cancers have Actionable Tumor Mutations

[redacted]	MM	*TSC1*	p.S828R	Tuberous Sclerosis Type 1, Lymphangioleiomyomatosis, Focal Cortical Dysplasia, and Everolimus Sensitivity	No	Nonsynonymous SNV, Autosomal Dominant, Patient also has a Germline TSC2 Mutation	No
[redacted]	MM	*TSC2*	p.T246A	Tuberous Sclerosis Type 2, and Lymphangioleiomyomatosis	Yes	Nonsynonymous SNV, Autosomal Dominant, Patient also has a Germline TSC1 Mutation	No

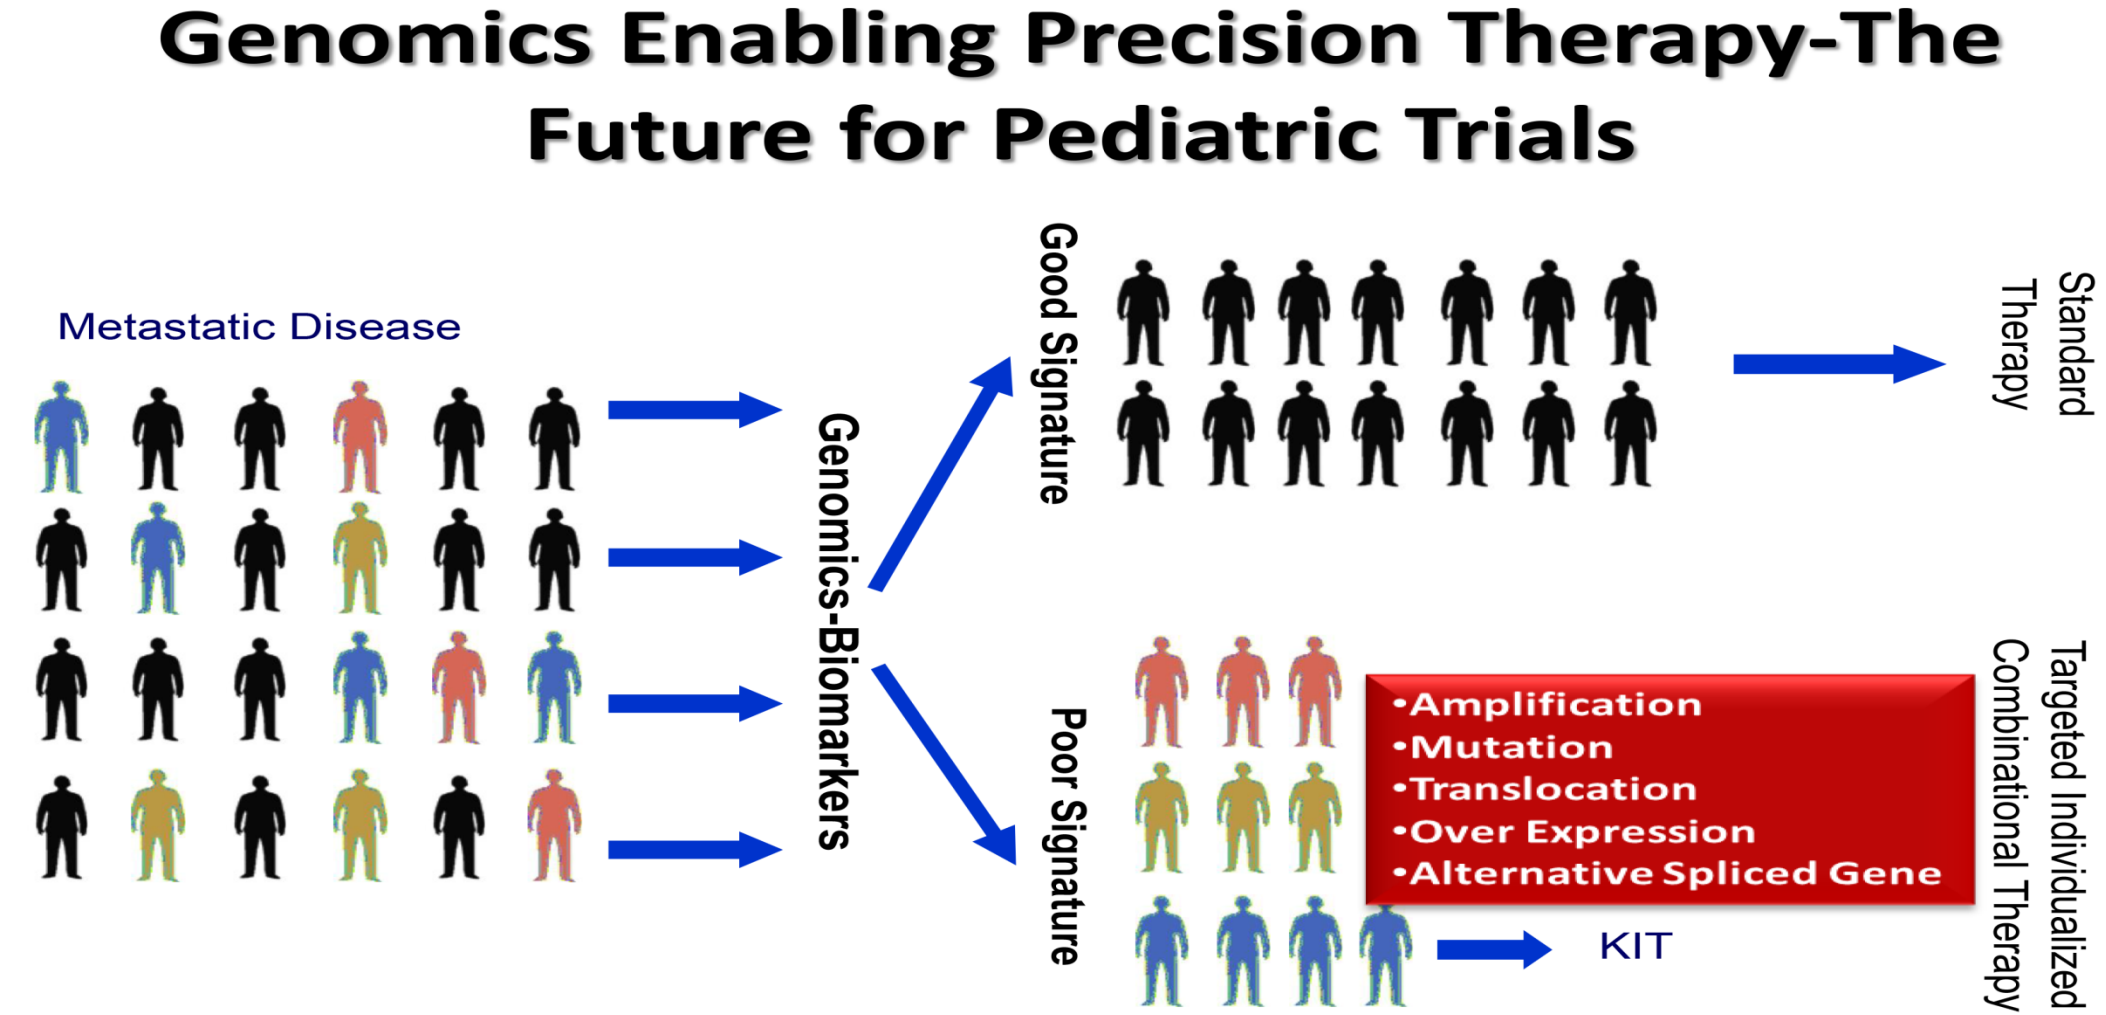
Chang et al. Clin Cancer Res. 2016

Summary

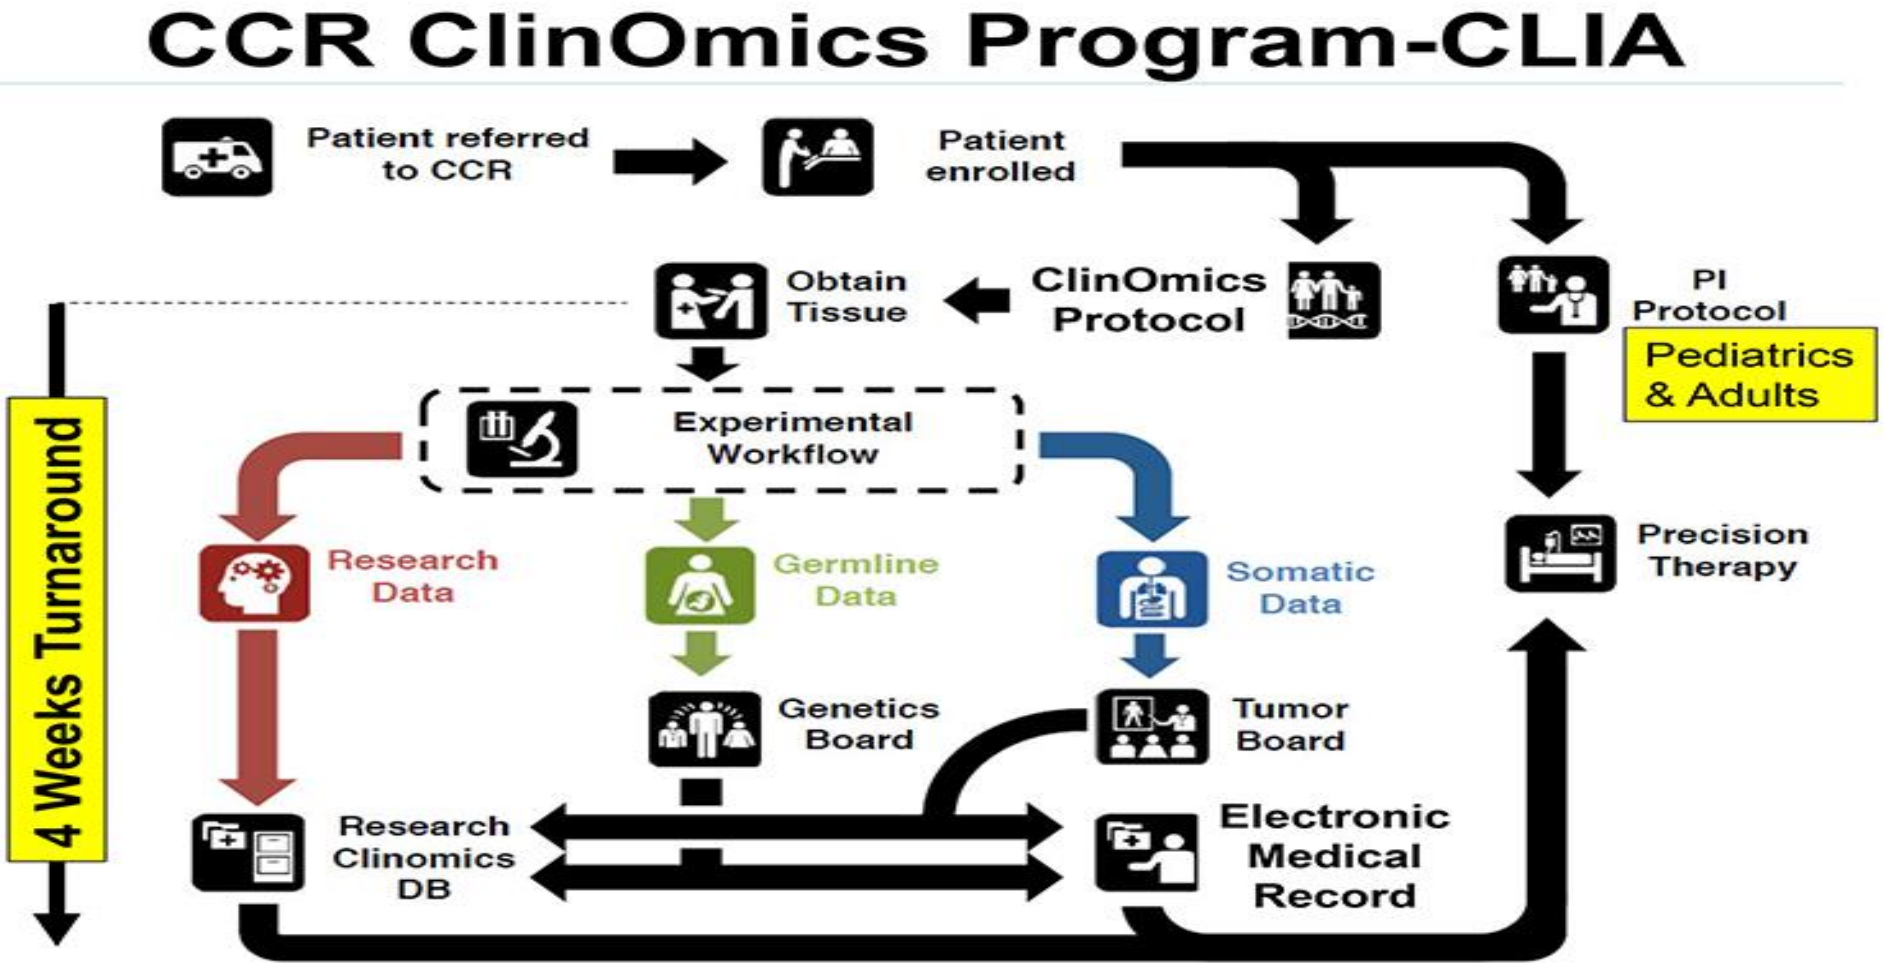
Summary

- Demonstrated the importance and feasibility of performing multi-dimensional ClinOmics in the clinical setting in real time
- ~50% of children with pediatric or AYA patients with relapsed or refractory cancers have actionable somatic mutations
- ~ 10% have actionable germline mutations
- Importance of performing parallel germline sequencing; some therapeutically actionable (e.g. DNA repair, PTEN, TSC1, TSC2, HRAS, RET, ALK)
- Increased tumor burden in relapsed tumors; implications for immunotherapy
- Single agent pediatric MATCH like trials are planned by COG-NCI

Future Trials



ClinOmics program



Operational goals

Operational Goals

Clinical Genomics Platform

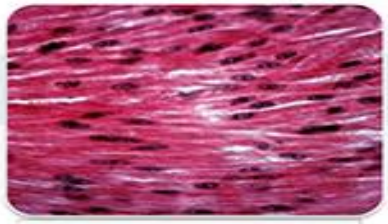
- Enable precision therapy trials for patients with cancer-
- Panel & Exome for tumor and normal

Research Comprehensive Genomics

- RNAseq transcript - ome analysis of tumor
- SNP arrays tumor, normal
- Methylation arrays tumor

Patient-derived Tumor Models

- PDX from tumor and blood
- Conditional reprogram-med cells from tumor, PDX
- Exome / RNAseq on models



Biobanking &Tissue Repository

- Tumor, germ line
- DNA, RNA
- Plasma, Serum, Urine, Circulating tumor cells, DNA, RNA

Exome vs. Panel

Exome vs. Panel (both CLIA)

- **Exome-All Protein Coding Genes**
  - Mutations in dominant clone
  - Novel driver mutations
  - Actionable secondary/incidental findings in germline in non-cancer genes
- **Panel- Cancer Genes**
  - Validates exome NGS results
  - Deeper coverage allows subclone detection
  - Copy number changes and LOH
  - Fusion gene detection

Conclusions

Conclusions

1. Integrated analysis of the cancer genome indentifies biologically relevant diagnostic, prognostic biomarkers and novel targets for therapy
2. Powerful emerging tools of next generation sequencing (including whole genome, exome, and transcriptome) will determine the complete genomic portrait of pediatric cancers at the base pair level
3. This will lead to the identification of key drivers and will enable the development of future novel therapies and precision therapy
